十一．注意事項 HANDLING PRECAUTIONS FOR CERAMIC CAPACITORS

11.1 使用電壓 (Operating voltage)

使用電容器時，端子間施加的電壓應該低於額定電壓。直流電壓上疊加交流電壓時，峰值電壓應該低於額定電壓。用交流電壓或脈衝電壓時，峰電壓也應該低於額定電壓。另外，確認使用的電源設備是不是有可能印加異常電壓（浪涌電壓，靜電，開關突峰電壓），如果產生則異常電壓也應該低於額定電壓（如下圖示）。交流一次側回路時，用於防止雜波的電容器其交流耐壓試驗的實驗條件不能超過規定的條件（電壓、時間、波形）。

Use within the rated voltage of capacitor between terminals. For DC rated voltage application, you should control the peak voltage (V_{o-p}) under the rated voltage in case the AC voltage is superimposed on the DC voltage. Use within the rate voltage includes peak voltage (V_{p-p}) when AC voltage or impulse voltage applied in a circuit. Confirm irregular voltage (surge voltage, static electricity, switching noise, etc) occurs in the equipment used, and use within the rated voltage containing the irregular voltage.

When the capacitor is used as a noise suppressor in the AC primary circuit, the voltage proof test should be within the specified conditions (voltage, time, wave form, etc).

11.2 使用溫度(Temperature)

使用時，電容器的表面溫度，包括其自身發熱，必須低於規格書規定的最高使用溫度。

Be sure to use only those operating temperature described in our catalogue or specification. Keep the surface temperature under the maximum temperature, which includes the maximum self-heat temperature.

11.3 自身發熱(Self-exothermal)

在環境溫度 25℃，無冷卻風扇工作的狀態下，自身發熱（電容器的表面溫度與環境溫度的差值）必須在 20℃ 以下。在連續印加交流電壓或脈衝電壓，電流較大的回路中，更要特別的注意，在連續印加高頻電壓，高頻脈衝電壓的回路中，雖然在額定電壓以下，也有可能影響到信賴性，所以使用時要考慮減輕負荷及自身發熱。

Self-exothermal temperature should be within 20℃ on the condition of atmosphere temperature 25℃ without the influence of wind such as the cooling fan. Be sure to use a capacitor in a circuit of current increase by AC voltage or pulse voltage applied.

When high frequency voltage or impulse voltage applied in a circuit, reliability should be influenced. Take into considerations the load reduction and self-exothermal temperature, even if voltage should be within the rated voltage.

11.4 電容器的靜電容量變化(Capacitance change of capacitors)

由於使用溫度和施加電壓的不同，電容器的容量有可能發生變化；而且，電容器在放置期間，靜電容量也有可能減少，也就是老化特性。

For some of the capacitors, capacitance value may change considerably in the temperature range, or by applied DC voltage. And capacitor has aging characteristic (capacitance decreases by keeping as it is).

		Ver:	1.0
	SAFETY STANDARD CERTIFIED CERAMIC CAPACITOR (Y2 TYPE)	Page	22/22

11.5 電容器的振動(Vibration of capacitors)

電容器（種類Ⅱ）在交流回路或者脈衝回路中使用時，由於特定的頻率，電容器本身可能會發生振動，或者發出聲音、噪音。所以在使用之前，請確認能否符合貴司要求。

When the capacitor (class 2) is used in the AC circuit, or pulse circuit, the capacitor might vibrate or noise might occur in the specified frequency. Be sure to confirm the conditions before using the capacitor.

11.6 電容器的使用及保存（保管）(Usage of capacitance and storage)

請不要再以下地方使用電容器(Please do not use capacitors in the following locations.)

- ★ 日光直射到的地方（Places where can be shined by direct sunlight）
- ★ 直接接觸到水及鹽水的地方（Places where can direct access with water or salt water）
- ★ 凝結露水的地方（Places of having dew condensation）
- ★ 有腐蝕性氣體的地方，如硫化氫、亞硫酸等 Places of having corrosive gases, Such as hydrogen sulfide, sulfuric acid, etc.)
- ★ 電容器請不要保存在高溫高濕的環境中，而應保存在室溫-10~40℃，濕度85%RH以內的環境中，並在納入後6個月內使用。Capacitors should not be kept in the environment of high temperature and high humidity, and should be kept in the environment where the room temperature between -10 ~ 40 ℃, and the humidity between 85%. Besides, the capacitors should be used within 6 months.
- ★ 電烙鐵的烙鐵頭不要直接接觸到電容器引腳以外的部位。

Electric soldering iron tip should not directly contact the areas except capacitor lead.

11.7 安裝上的注意點(Inserting precautions)

用自動插件機把電容器插入到基板上時，要確認並管理插件機的安裝條件（推動器壓力，剪切部的調整等），製品拔取，導線剪切時，不要對製品施加過度的衝擊和壓力。電容器的端子間隔要與基板孔的間隔一致。（外力改變導線間距的時候，有可能會損壞導線根部的塗料，如果發生此類的損壞，就有可能導致信賴性下降。）

When inserting capacitors into the PC board by automatic insertion machine, confirm the conditions (such as pressure of pusher, adjustment of clinching portion) and minimize the impact force by chucking the body, or clinching the lead terminals. Distances between the hole position onto a PC board should be equal to the pitch of capacitors. When stretching the lead terminal, any force may load the bottom of the capacitor body and result in damage to the insulation coating.

Severe damages may cause poor reliability.

11.8 焊錫(Solder)

- ★ 焊錫條件（預熱的溫度及時間，焊錫的溫度及時間）在規格書規定範圍內。

Soldering conditions, such as pre-heat temperature, soldering temperature, and soldering time, should be followed by the descriptions in our catalogue or specification.

- ★ 修正作業的時候，要進行充分預熱，並進行溫度管理。

When reworking for soldering, sufficient pre-heating and temperature control should be used.
